                                                                                                                                                                                                                                                                                                                                              invention may allow for accurate and efficient high throughput screening. The present sequence is that of a PCR primer which is related to the
                                                                                                                                                                                This invention relates to a novel hybridisation assay probe, for detecting a nucleic acid, which is a probe sequence that comprises a target-complementary sequence of bases, and optionally one or more base sequences that are not complementary to the nucleic acid that is to be detected. The hybridisation assay probes and the kits are useful in detecting and amplifying a target nucleic acid sequence, for example flavivirus like West Nile virus, that may be present in a biological sample. West Nile virus (MNV) is an RNA virus that primarily infects birds and culex mosquitos, with humans and horses serving as incidental hosts. Infection of humans can lead to meningitis or encephalitis. The
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    New hybridization assay probe comprising target-complementary sequence bases, useful in detecting flavivirus, e.g. West Nile virus.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps

                                                                                                                                                                                                                                invention may allow for accurate and efficient high throughput screening.
The present sequence is that of an oligonucleotide probe which is related
                              This invention relates to a novel hybridisation assay probe, for detecting a nucleic acid, which is a probe sequence that comprises a target-complementary sequence of bases, and optionally one or more base sequences that are not complementary to the nucleic acid that is to be detected. The hybridisation assay probes and the kits are useful in detecting and amplifying a target nucleic acid sequence, for example flavivirus like West Nile virus, that may be present in a biological sample. West Nile virus (MNV) is an RNA virus that primarily infects birds and culex mosquitos, with humans and horses serving as incidental hosts. Infection of humans can lead to meningitis or encephalitis. The
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             This invention relates to a novel hybridisation assay probe, for detecting a nucleic acid, which is a probe sequence that comprises a target-complementary sequence of bases, and optionally one or more base sequences that are not complementary to the nucleic acid that is to be detected.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             This invention relates to a novel hybridisation assay probe, for detecting a nucleic acid, which is a probe sequence that comprises a target-complementary sequence of bases, and optionally one or more base sequences that are not complementary to the nucleic acid that is to be detected. The hybridisation assay probes and the kits are useful in detecting and amplifying a target nucleic acid sequence, for example flavivius like West Nile virus, that may be present in a biological sample. West Nile virus (WNV) is an RNA virus that primarily infects birds and culex mosquitos, with humans and horses serving as incidental hosts. Infection of humans can lead to meningitis or encephalitis. The

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             hosts. Infection of humans can lead to meningitis or encephalitis. The invention may allow for accurate and efficient high throughput screening. The present sequence is that of an oligonucleotide probe which is related
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        This invention relates to a novel hybridisation assay probe, for detecting a nucleic acid, which is a probe sequence that comprises a target-complementary sequence of bases, and optionally one or more base sequences that are not complementary to the nucleic acid that is to be detected. The hybridisation assay probes and the kits are useful in detecting and amplifying a target nucleic acid sequence, for example flavivirus like West Nile virus, that may be present in a biological sample. West Nile virus (WNV) is an RNA virus that primarily infects birds and culex mosquitos, with humans and horses serving as incidental hosts. Infection of humans can lead to meningitis or encephalitis. ```

```
Analyzing a target nucleic acid sequence in a biological material by real time PCR using nucleic acid primers that are separated by at least 750 nucleic acid residues in the target sequence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The invention relates to a novel method for analysing a target nucleic acid sequence in, a biological material. The method comprises adding at least two nucleic acid primers that hybridise under stringent conditions to predetermined nucleic acid sequences of the target nucleic acid sequences of the target nucleic acid sequence by PCR, and detecting and sequence that are separated by at least 750 nucleic acid residues, amplifying the target nucleic acid sequence by PCR, and detecting and quantifying the target nucleic acid sequence. The methods and compositions of the present invention are useful for analysing a target nucleic acid sequence in a biological material by real time PCR using nucleic acid primers that are separated by at least 750 nucleic acid residues in the target sequence. This polynucleotide sequence represents the genomic DNA of a West Nile virus used in the target analysis method
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Sequence 10945 BP; 2999 A; 2457 C; 3143 G; 2346 T; 0 U; 0 Other;

Determining level of potentially active biological pathogens in biological material, by adding nucleic acid primer pairs to biological material, amplifying target nucleic acid by PCR, detecting and quantifying target nucleic acid.

Disclosure; SEQ ID NO 5; 111pp; English.

The Invention relates to a mentiod of deternining [MI] is red and deterially active biological pathogens in biological material, involves diding at least two nucleic acid sequences, where quantity of the nucleic acid sequences, where quantity of the nucleic acid sequences, where quantity to fit he nucleic acid sequences; he composed in the biological pathogens in a biological material such as cells, it is biological pathogens in a biological material such as cells, it is biological pathogens, immunoglobulins, bone marrow, heart valves, cartilage, corneas, arteries, veins, organs, tissued marrow, heart valves, cartilage, corneas, arteries, veins, organs, camples, mummifical material, human or animal remains, stem cells, islet camples, mummifical material, human or animal remains, stem cells, islet camples, mummifical material, human or animal remains, stem cells, islet blood cells or platelets. The biological pathogen is chosen from Aspreyllius, calls pathogen is chosen from Aspreyllius, calls in the biological pathogen is chosen from Aspreyllius, calls in the statement of the camplobacter, Haliobacter, isletcia, clearidium, streptones, cornevines, camples, callicomia encephalitis virus, cornevines, Eschericinia, benotical, callifornia encephalitis virus, flateria, callifornia encephalitis virus, flateria, callifornia encephalitis virus, flateria, callifornia encephalitis virus, flateria, cornevines, flateria, plateria, plateria The invention relates to a method of determining (M1) level of

to a potentially active biological pathogens. This sequence corresponds west Nile virus DNA detected by the method of the invention.

The present sequence represents the genome of a strain of West Nile virus (WNV), designated IS-98-STI. This strain is a neuroinvasive and neurovirulent strain of WNV. Polynucleotides and polypeptides derived from the IS-98-STI genome are useful for diagnosis and prognosis of Flavivirus infection, specifically WNV-mediated encephalitis. They are also useful to raise specific antibodies, for recombinant expression of WNV proteins or peptides (for diagnosis, production of antibodies and identification of specific binding partners in cells), for identifying cellular genes implicated in resistance to viral infection, and for
                                                                                                                                                                                                                                                                                                                                                                     Deubel V, Guenet J, Drouet M, Malkinson M, Banet Courageot M, Coulibaly F, Catteau A, Flamand M,

Japanese encephalitis virus; Dengue virus; St Louis encephalitis virus.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The invention relates to a diagnostic kit comprising at least one isolated and purified polypeptide comprising a West Nile Virus (WNV) envelope (E) protein or its immunogenic fragment having a native conformation or non-denatured structure and that is reactive with antibodies against WNV and cross-reactive with antibodies against a flavivirus. The diagnostic kit is useful in diagnosing flavivirus infection caused by DERV, WNV, JEV or SLEV. This sequence corresponds the complete nucleotide sequence of the WNV isolate 2741.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Gaps

New diagnostic kit comprising West Nile Virus (WNV) envelope protein reactive with antibody against WNV and cross-reactive with antibody against a flavivirus, useful in diagnosing flavivirus infection caused by DENV, WNV, JEV or SLEV.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             New nucleic acid molecule that modulates replication of West Nile Virus
                                                                                                                                                                                                                                                                                                                                                                            antibodies against WNV and cross-reactive with antibodies against a flavivirus. The diagnostic Kit is useful in diagnosing flavivirus infection caused by DENV, WNV, JEV or SLEV. This sequence corresponds the complete nucleotide sequence of the WNV isolate 3356.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         WNV; West Nile Virus; antiinflammatory; cytostatic; hepatotropic; viruole; neuropyotective; antibacterial; replication; pancreatitis; encephalitis; myocarditis; meningitis; infection; hepatitis; liver failure; cancer; cirrhosis; Hammerhead; Inozyme; DNAzyme;
                                                                                                                                                                                                                                                                                                        The invention relates to a diagnostic kit comprising at least one isolated and purified polypeptide comprising a West Nile Virus (WNV) envelope (B) protein or its immunogenic fragment having a native conformation or non-denatured structure and that is reactive with

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ð
                                                                                                                                                                                                                                                                                                                                                                                                      The present invention relates to a method for identifying compounds (I) that can stimulate a gene of the OAS (2'-5'-oligoadenylate synthase) a method comprises: (a) inducing expression of the OAS gene in a culture of cells from a non-human mammal (Flvr/Flvr or Flvr/Flvs; indicating resistance or sensitivity to Flavivirus infection); (b) treating cells with test compound; and (c) measuring activity of OAS gene relative to a control. (I) are potentially useful as antiviral agents for treating infections by Flaviviruses (e.g. hepatitis C; dengue; yellow fever and various forms of encephalitis). Genomic OAS DNA and derived connection; (b) in screening for anti-flavivirus agents, and (c) for evaluating sensitivity of subjects to Flavivirus agents, and (c) for evaluating sensitivity of subjects to Flavivirus infection and their confile of the forms of subjects to Flavivirus infection and their confile of the forms of such infections. The present sequence is weet Nile Virus strain NY99-flamingo 382-99 (IS-98-STI) complete
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ö
                                                                                                                                                                                                                                                                                                        Identifying stimulators of oligoadenylate synthase family genes, useful as antiviral agents against Flavivirus, also mutated genes responsible for sensitivity to virus.

of the West Nile Virus (WNV). The nucleic acid molecules are useful for treating a condition related to WNV infection e.g. pancreatitis, encephalitis, meningitis, meningitis, neurologic infection, hepatitis, understanding a condition related to WNV infection e.g. pancreatitis, liver failure, hepatocellular carcinoma or cirrhosis. The nucleic acid molecule is selected from the group of ribozymes consisting of hammerhead, inozyme, G-cleaver, DNAzyme, Amberzyme and Zinzyme. The nucleic acid molecules further comprise at least five ribose residues, at least ten 2'-O-methyl modifications, phosphorochioate linkages on at least three of the 5' terminal nucleotides and a 3' end modification of a 3'-3' inverted abasic molety. Nucleic acid molecules SEQ ID No I to 37080 are claimed; however, SEQ ID No 2194-2206 and 17502-17514 are not given in the specification.
                                                                                            invention relates to nucleic acid molecules that modulate replication
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    New nucleic acid molecule that modulates replication of West Nile Virus (WNV), useful for treating a condition related to WNV infection e.g. pancreatitis, meningitis, hepatocellular carcinoma or cirrhosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                               Gaps
(WNV), useful for treating a condition related to WNV infection e.g. pancreatitis, meningitis, hepatocellular carcinoma or cirrhosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            WNV; West Nile Virus; antiinflammatory; cytostatic; hepatotropic; virucide; neuroprotective; antibacterial; replication; pancreatitis; encephalitis; myocarditis; meningitis; infection; hepatitis; liver failure; cancer; cirrhosis; Hammerhead; Inozyme; DNAzyme;

```

The invention relates to nucleic acid molecules that modulate replication of the West Nile Virus (WNV). The nucleic acid molecules are useful for

```
ô
treating a condition related to WNV infection e.g. pancreatitis, encephalitis, myocarditis, meningitis, neurologic infection, hepatitis, liver failure, hepatocellular carcinoma or cirrhosis. The nucleic acid molecule is selected from the group of ribozymes consisting of Hammerhead, Inozyme, G-cleaver, DNAzyme, Amberzyme and Zinzyme. The nucleic acid molecules further comprise at least five ribose residues, the feast ten 2-0-methyl modifications, phosphorothicate linkages on at least three of the 5' terminal nuclecides and a 3' end modification of a 3'-3' inverted abasic molety. Nucleic acid molecules EEQ ID NO 1 to 37080 are claimed; however, SEQ ID NO 2194-2206 and 17502-17514 are not given in the specification. The present sequence is that of a nucleic acid
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The invention relates to nucleic acid molecules that modulate replication of the West Nile Virus (WNV). The nucleic acid molecule is selected from the group of ribozymes consisting of Hammerhead, Inozyme, G-cleaver, DNAzyme, Amberzyme and Zinzyme. The nucleic acid molecules further comprise at least five ribose residues, at least ten 2'-0-methyl modifications, phosphorothioate linkages on at
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                New nucleic acid molecule that modulates replication of West Nile Virus (WNV), useful for treating a condition related to WNV infection e.g. pancreatitis, meningitis, hepatocellular carcinoma or cirrhosis.
                                                                                                                                                                                                                                                                                                                                                     Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               detecting a nucleic acid, which is a probe sequence that comprises a target-complementary sequence of bases, and optionally one or more base sequences that are not complementary to the nucleic acid that is to be detected. The hybridisation assay probes and the kits are useful in detecting and amplifying a target nucleic acid sequence, for example flavivirus like West Nile virus, that may be present in a biological sample. West Nile virus (MNV) is an RNA virus that primarily infects birds and culex mosquitos, with humans and horses serving as incidental hosts. Infection of humans can lead to meningitis or encephalitis. The invention may allow for accurate and efficient high throughput screening. The present sequence is that of an oligonucleotide probe which is related to the invention.
least three of the 5' terminal nucleotides and a 3' end modification of a 3'-3' inverted abasic moiety. Nucleic acid molecules SEQ ID NO 1 to 37080 are claimed; however, SEQ ID NO 2194-2206 and 17502-17514 are not given in the specification. The present sequence is that of a nucleic acid
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ĕ

New hybridization assay probe comprising target-complementary sequence of bases, useful in detecting flavivirus, e.g. West Nile virus.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                hosts. Infection of humans can lead to meningitis or encephalitis. The invention may allow for accurate and efficient high throughput screening. The present sequence is that of an oligonucleotide probe which is related
                                                                                                                                                                                                                                                                                                                                                                                                              This invention relates to a novel hybridisation assay probe, for detecting a nucleic acid, which is a probe sequence that comprises a target-complementary sequence of bases, and optionally one or more base sequences that are not complementary to the nucleic acid that is to be detected. The hybridisation assay probes and the kits are useful in detecting and amplifying a target nucleic acid sequence, for example flavivirus like West Nile virus, that may be present in a biological sample. West Nile virus (WNV) is an RNA virus that primarily infects birds and culex mosquitos, with humans and horses serving as incidental hosts. Infection of humans can lead to meningitis or encephalitis. The
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        94.4%; Score 17; DB 12; Length 19; 100.0%; Pred. The present invention relates to a method for screening for a flavivirus in a subject or animal host. The method comprises: contacting a sample from the subject with a composition comprising a flavivirus envelope protein domain III polypeptide (ADK13683-ADK13701) under conditions that permit formation of specific immunocomplex between an antibody in the sample and the envelope protein domain III polypeptide; and detecting whether a specific immunocomplex is formed. The present sequence is the coding sequence for West Nile Virus protein, from which B protein envelope protein domain III polypeptide (ADK13683) is derived.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Diagnosing flavivirus infection by contacting a sample from a human or animal with a flavivirus envelope protein domain III polypeptide, and detecting formation of a immunocomplex between the envelope protein and

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ay allow for accurate and efficient high throughput screening. sequence is that of an oligonucleotide probe which is related
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            This invention relates to a novel hybridisation assay probe, for detecting a nucleic acid, which is a probe sequence that comprises a target-complementary sequence of bases, and optionally one or more base sequences that are not complementary to the nucleic acid that is to be detected. The hybridisation assay probes and the kits are useful in detecting and amplifying a target nucleic acid sequence, for example flavivirus like West Nile virus, that may be present in a biological sample. West Nile virus (WN) is an NNA virus that primarily infects birds and culex mosquitos, with humans and horses serving as incidental hosts. Infection of humans can lead to meningitis or encephalitis.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ö
                                                                                                                                                                                                                                                                                                                             The invention relates to nucleic acid molecules that modulate replication of the West Nile Virus (WNV). The nucleic acid molecules are useful for treating a condition related to WNV infection e.g. pancreatitis, encephalitis, myocarditis, meningitis, neurologic infection, hepatitis, liver failure, hepatocellular carcinoma or cirrhosis. The nucleic acid molecule is selected from the group of ribozymes consisting of Hammerhead, Inozyme, G-cleaver, DNAzyme, Amberzyme and Zinzyme. The nucleic acid molecules further comprise at least five ribose residues, at least then 2.0-omethyl modifications, phosphorothicate linkages on at least three of the 5' terminal nucleotides and a 3' end modification of a 3'-3' inverted abasic moiety. Nucleic acid molecules SEQ ID NO 1 to 37080 are claimed; however, SEQ ID NO 2194-2206 and 17502-17514 are not given molecule of the invention
                                                                                                                                                                                                                                                           New nucleic acid molecule that modulates replication of West Nile Virus (WNV), useful for treating a condition related to WNV infection e.g. pancreatitis, meningitis, hepatocellular carcinoma or cirrhosis.

The invention relates to nucleic acid molecules that modulate replication of the West Nile Virus (WNV). The nucleic acid molecules are useful for treating a condition related to WNV infection e.g. pancreatis, incorpulatis, myocarditis, meningitis, neurologic infection, hepaticis, liver failure, hepatocallular carcinoma or cirrhosis. The nucleic acid molecule is selected from the group of ribozymes consisting of Hammerhead, Inozyme, G-cleaver, DNAzyme, Amberzyme and Zinzyme. The nucleic acid molecules further comprise at least five ribose residues, at least three of the 5' terminal nucleotides and a3' end modification of a 3'-3' inverted abasic moiety. Nucleic acid molecules SEQ ID NO 1 to 37080 are claimed; however, SEQ ID NO 2194-2206 and 17502-17514 are not given in the specification. The present sequence is that of a nucleic acid
                                                                                                                                                                                                                                                                                                                                                                                                                                                                        New nucleic acid molecule that modulates replication of West Nile Virus (WNV), useful for treating a condition related to WNV infection e.g. pancreatitis, meningitis, hepatocellular carcinoma or cirrhosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    WNV; West Nile Virus; antiinflammatory; cytostatic; hepatotropic; virucide; neuropxotective; antibacterial; replication; pancreatitis; encephalitis; myocarditis; meningitis; infection; hepatitis; liver failure; cancer; dirrhoais; Hammerhead; Inozyme; DNAzyme;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ö

                                                                                                                                                                                                                                                                                                                                                                            셤
                                                                                                                                                                                       The invention relates to nucleic acid molecules that modulate replication of the West Nile Virus (WNV). The nucleic acid molecules are useful for treating a condition related to WNV infection e.g. pancreatitis, encephalitis, myocarditis, meningitis, neurologic infection, hepatitis, liver failure, hepatocellular carcinoma or cirrhosis. The nucleic acid molecule is selected from the group of ribozymes consisting of Hammerhead, Inozyme, G-cleaver, DMAZyme, Amberzyme, and Zinzyme. The nucleic acid molecules further comprise at least five ribose residues, at least ten 2'-O-methyl modifications, phosphorothioate linkages on at least three of the 5' terminal nuclecides and a 3' end modification of a 3'-3' inverted abasic moiety. Nucleic and molecules SEQ ID NO 1 to 37080 are claimed, however, SEQ ID NO 2194-2206 and 17502-17514 are not given in the specification. The present sequence is that of a nucleic acid

encoded by ABZ71062 to ABZ71130 (II), which are isolated from an incoded by ABZ71062 to ABZ71130 (II), which are isolated from Wycobacterium tuberculosis. (I) are encoded by genes (II) whose expression is induced or up-regulated during culture of a mycobacterium under conditions defined by a dissolved oxygen tension of at least 10% as a saturation measured at 37 plus degrees Celsius, when compared with a plus degrees Celsius. (I) and (II) have antibacterial, tuberculostatic and immunostimulant activities, and can be used in vaccines and gene therapy. (I) and (II) can be used for the manufacture of a medicament for treathing or preventing a mycobacterial infection. They can also be used for the manufacture of a diagnostic reagent for identifying a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           This invention relates to a method for identifying a nucleotide or polypeptide sequence that may be a drug target, or essential for growth or vlability of an organism. Polynucleotide sequences ABH51947 - AAH52092 represent DNA encoding proteins ABM51096 - AAG81294, Mycobacterium tuberculosis proteins which are potential drug targets. The DNA and protein sequences are used to illustrate the method of the invention. The
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Identifying nucleotide or polypeptide sequence for use as drug target, involves providing algorithm that analyzes a functional relationship between nucleotide or polypeptide sequences, and comparing the sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Gaps
vaccine for treating or preventing mycobacterial infections, and as diagnostic reagents for identifying such infections.
                                                                                                                         sednences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Mycobacterium tuberculosis potential drug target gene SEQ ID 49.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention is useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA aequences (ABL16176-ABL30511), expressed DNA ABB72072). The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences
                                                                        g g
   method involves providing an unknown nucleotide or polypeptide sequences.
                and comparing it to a number of sequences along with at least one algorithm capable of analysing a functional relationship between nucleotide and polypeptide sequences. The method is useful for characterising the function of nucleic acids and polypeptides that may useful as a target for a drug or essential for the growth or viability an organism
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               New isolated nucleic acid detection reagent for detecting 1000 or more genes from Drosophila and for elucidating cell signaling and cell-cell

The invention relates to a method of producing West Nile viruses (WNVs)

CC by infecting a cell (preferably a human cell) which expresses an

CC adenovirus ElA protein with West Nile virus, or by tranforming the cell

cuith the West Nile virus genome. The invention also relates to a West

Nile virus produced by the method of the invention; vaccine compositions

CC containing such viruses, or containing a whole-inactivated lineage II

West Nile virus; and human cells, named PER.CC cells and deposited under

CC ECACC number 96022440, having at least an adenovirus ElA gene integrated

into its genome and which comprises a nucleic acid coding for a West Nile

virus. The method and cells of the invention produce high titres of West

CC virus. The method and cells of the invention of whole-inactivated West

Nile virus, such viruses can be used in vaccines for the prophylaxis,

CC therapy and/or diagnosis of West Nile disease. These vaccines are also

CR therapy and/or diagnosis of West Nile disease. These vaccines are also

CR seful for cross-vaccination against viruses that are highly similar to

CC west Nile virus. Sequences ADD21520 represent reverse

CC samples from infected human cells.
                                                                                                                               Producing West Nile virus useful as vaccine against West Nile virus infection, involves infecting cell, or culture of cell with West Nile virus and culturing cells.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       29-JUN-1999
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 30-JUN-1999
  This invention relates to a novel method for altering one or more plant characteristics. Specifically, it refers to identifying genes that are up characteristics. Specifically, it refers to identifying genes that are up convar-regulated in transgenic plants overexpressing the heterodimeric E2Pa/DPa transcription factor of Arabidopsis and using these sequences to alter plant characteristics accordingly. The present invention describes companies, theraspeutics, pharmaceuticals and animal feed products, where the altered plant characteristics are selected from increased yield or companies, enhanced survival capacity, stress tolerance, plant architecture or physiology, altered endoreduplication, biochemistry, signal cransduction, storage lipid mobilisation and/or altered photosynthesis, cach relative to the corresponding wild type plants. Accordingly, these sequences can also be useful as positive or negative selectable markers of uning transformation of cells or tissues. The identified genes play a cole in a variety of biological processes such as DNA replication, cell or more in plants overexpressing the E2Fa/DPa cranscription factor, given in an exemplification of the invention.
         Altering plant characteristics, useful for producing plants for enzyme opharmaceutical production comprises modifying in a plant, expression of one or more nucleic acids and/or modifying level or activity of one or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Hybridisation assay; genetic mapping; gene expression control; protein identification; signal transduction pathway; metabolic pathway; promoter; termination sequence; ss.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         New isolated cancer associated nucleic acids comprising at least 10 contiguous nucleotides, useful for diagnosing, preventing and/or treating cancers such as leukemia and lymphoma.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The present invention relates to cancer associated sequences (ADQ97025-ADQ98004). The sequences are useful for the diagnosis, prevention and/or treatment of cancer, such as leukemia and lymphoma. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic formate directly from WIPO at

The invention relates to nucleic acid molecules that modulate replication of the West Nile Virus (MNV). The nucleic acid molecules are useful for treating a condition related to MNV infection e.g. pancreatitis, encapialitis, meningitis, neurologic infection, hepatitis, neurologic infection, hepatitis, molecule is selected from the group of ribozymes consisting of Hammerhead, Inozyme, G-cleaver, DNAzyme, Amberzyme and Zinzyme. The nucleic acid molecules further comprise at least five ribose residues, at least then 2-0-methyl modifications, phosphorothiate linkages on at least three of the 5' terminal nucleotides and a 3' end modification of a 3'-3' inverted abasic moiety. Nucleic acid molecules SEQ ID NO 1 to 37080 are claimed; however, SEQ ID NO 2194-2206 and 17502-17514 are not given molecule of the invention
                                                                                                                                                                                                                                New nucleic acid molecule that modulates replication of West Nile Virus (WNV), useful for treating a condition related to WNV infection e.g. pancreatitis, meningitis, hepatocellular carcinoma or cirrhosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        WNV; West Nile Virus; antiinflammatory; cytostatic; hepatotropic; virucide; neuroprotective; antibacterial; replication; pancreatitis; encephalitis; myocarditis; meningitis; infection; hepatitis; liver failure; cancer; cirrhosis; Hammerhead; Inozyme; DNAzyme;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               associated (CA) nucleic acids encoding them. The invention also relates to a method for treating cancers involving administering to a patient an inhibitor of CAP, and a method of screening for anticancer activity in a potential drug involving providing a call that expresses a CA gene, contacting a tissue sample derived from a cancer cell with an anticancer drug candidate and monitoring the effect of the anticancer drug candidate. The CA gene. The CAP proteins are useful for detecting cancer associated with expression of a CAP protein in a test cell sample and for screening for a bloactive agent capable of modulating the cancer, involving determining the expression of a CA nucleic acid in a cissue. This sequence represents human CA cDNA of the invention. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The invention relates to cancer-associated proteins (CAP) and the cancer-

The invention relates to nucleic acid molecules that modulate replication of the West Nile Virus (WNV). The nucleic acid molecules are useful for treating a condition related to WNV infection e.g. pancreatitis, encephalitis, myocarditis, meningitis, neurologic infection, hepatitis, liver failure, hepatocellular carcinoma or cirrhosis. The nucleic acid molecule is selected from the group of ribozymes consisting of Hammerhead, Inozyme, G-cleaver, DNAzyme, Amberzyme and Zinzyme. The nucleic acid molecules further comprise at least five ribose residues, at least three of the 5' terminal nucleotides and a 3' end modification of a 3'-3' inverted abasic moiety. Nucleic acid molecules SEQ ID No 1 to 37080 are claimed; however, SEQ ID No 2194-2206 and 17502-17514 are not given in the specification. The present sequence is that of a nucleic acid The invention discloses a microarray comprising a plurality of nucleic acid probes including one of 2,018,500 fully defined sequences, or its perfect match, perfect mismatch, antisense match or antisense mismatch. Also disclosed is a method of gene expression analysis. The array is used in monitoring gene expression levels by hybridisation to a DNA library, in analysis of genetic variation or in hybridisation of tag-labelled compounds. The nucleic acid probes are specifically designed for analysis of at least one target sequence. The method of analysis comprises hybridising at least one or more nucleic acids to at least two or more New array of nucleic acid probes, useful for in situ hybridization, in Southern, Northern or dot-blot hybridization to identify or detect the sequence or specific mutations of any gene. nucleic acid probes and detecting the hybridisation. The nucleic acid probes are attached to a solid support. The analysis comprises monitoring gene expression levels, identifying biallelic markers or polymorphisms, or family members of a gene and a cross-species comparison. Each of the nucleic acids further comprises a tag sequence. The array of nucleic acids further comprises a tag sequence. The array of nucleic acids both hybridisation in Southern, Northern or dothot hybridisation to identify or detect the sequence or specific mutations of any gene, in mapping the 5' termini of mRNA molecules by primer extensions or in screening cDNA or genomic libraries or subclones for additional subclones containing segments of DNA that have been isolated and previously sequenced. The sequence presented is one of the nucleic acid probes incorporated in the microarray. Note: The sequence data for this patent can also be obtained in electronic format directly from USPTO at sequence.html

WPI; 2003-553970/52. P-PSDB; ABO44365 Novel isolated polynucleotide encoding a polypeptide comprising C-8,7 sterol isomerase activity, useful in the production of a transformed host cell and in the production of a transgenic plant.

Col 41-42; 42pp; English.

The invention relates to an isolated polynucleotide comprising a sequence encoding a polypeptide having C-8,7 sterol isomerase activity. The polynucleotide is useful for transforming a cell and producing a alternaspanic plant. The polynucleotide is useful in the production of altered levels of sterol biosynthetic enzyme in a transformed host cell. Nucleic acid fragments of the polynucleotide are useful to create transgenic plants in which sterol biosynthetic enzymes are present at higher or lower levels than normal or in cell types or developmental stages in which they are not normally found. The nucleic acid fragments are also useful as probes for genetically and physically mapping the genes that they are a portion of and as markers for traits linked to

encoding a polypeptide having C-8.7 sterol isomerase activity. The polynucleotide is useful for transforming a cell and producing a transgence plant. The polynucleotide is useful in the production of transgence plants. The polynucleotide is useful in the production of the polynucleotide are useful to create transgence plants in which sterol biosynthetic enzyme are present at higher or lower levels than normal or in cell types or developmental stages in which they are not normally found. The nucleic acid fragments are also useful as probes for genetically and physically mapping the cases that they are a portion of and as markers for traits linked to those genes. Such information is useful in plant breeding to develop lines with desired phenotypes. The nucleic acid fragments are also useful as proper in the nucleic acid fragments are also useful mapping and in direct fluorescence in situ hybridiation (FISH) mapping. The present sequence represents cDNA encoding a plant steroid 22-alpha
                                                                                                                                                                                                    ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Novel isolated polynucleotide encoding a polypeptide comprising C-8,7 sterol isomerase activity, useful in the production of a transformed host cell and in the production of a transgenic plant.
                 lines with desired phenotypes. The nucleic acid fragments are also useful as restriction fragment length polymorphism (RFLD) markers, for physical mapping and in direct fluorescence in situ hybridisation (FLSH) mapping. The present sequence represents cDNA encoding a plant steroid 22-alpha
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The invention relates to an isolated polynucleotide comprising a sequence

The invention relates to an isolated polynucleotide comprising a sequence encoding a polypeptide having C-8,7 sterol isomerase activity. The productide is useful for transforming a cell and production a transgenic plant. The polynucleotide is useful in the production of altered levels of sterol biosynthetic enzyme in a transformed host cell. Wholeic acid fragments of the polynucleotide are useful to create transgenic plants in which sterol biosynthetic enzymes are present at higher or lower levels than normal or in cell types or developmental stages in which they are not normally found. The nucleic acid fragments is tho useful as probes for genetically and physically mapping the genes that they are a portion of and as markers for traits linked to those genes. Such information is useful in plant breeding to develop lines with desired phenotypes. The nucleic acid fragments are also useful as restriction fragment length polymorphism (FRLP) markers, for physical mapping and in direct fluorescence in situ hybridisation (FISH) mapping.

The invention relates to an isolated polynucleotide comprising a sequence encoding a polypeptide having C-8,7 sterol isomerase activity. The polynucleotide is useful for transforming a cell and production a transformed blank. The polynucleotide is useful in the production of a transgenic plant. The polynucleotide is useful in the production of altered levels of sterol biosynthetic enzyme in a transformed host cell. Wholeic acid fragments of the polynucleotide are useful to create transgenic plants in which sterol biosynthetic enzymes are present at higher or lower levels than normal or in cell types or developmental stages in which they are not normally found. The nucleic acid fragments are also useful as probes for genetically and physically mapping the genes that they are a portion of and as markers for traits linked to those genes. Such information is useful in plant breeding to develop lines with desired phenotypes. The nucleic acid fragments are also useful as restriction fragment length polymorphism (FRLP) markers, for physical mapping and in direct fluorescence in situ hybridisation (FISH) mapping. The present sequence represents CDNA encoding a plant steroid 22-alpha
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Novel isolated polynucleotide encoding a polypeptide comprising C-8,7 sterol isomerase activity, useful in the production of a transformed host cell and in the production of a transgenic plant.
